Building Integration of Solar Thermal Systems - TU1205 - BISTS

Overview

- Optical modelling
- Ray trace methodology
- Optical efficiency simulations
- Solar radiation collection for a BISTS
- Practical Example :
 - Design a BISTS
 - Model optical performance
 - Predict solar radiation collection for given installation

European Cooperation in the field of Scientific and Technical Research

Building Integration of Solar Thermal Systems - TU1205 - BISTS

Optical modelling can be used to:

- Theoretically predict how the solar radiation interacts with the various BISTS components and determine optical performance of the system
- Determine important attributes such as optical efficiency, angular acceptance, flux profiles and solar radiation collection for given installation scenarios

COST is supported by the EU RTD Framework Programme

ESF provides the COST Office through an EC contract

SCIENCE COUNDRION

Building Integration of Solar Thermal Systems – TU1205 – BISTS

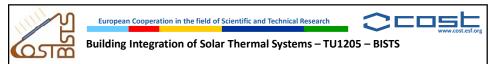

Remember:

- Optical modelling is a theoretical approach. So It's accuracy will depend on how well the BISTS and solar radiation properties have been simulated and on the assumptions made.
- Experimental characterisation is essential to determining with good/high accuracy the optical performance of a BISTS. However it will do so for a limited set of scenarios. <u>Appropriate combination of modelling and experimental results is the key!</u>
- The output from the optical modelling can be used carry out thermal modelling

ESF provides the COST Office through an EC contract CIENCE OUNDATION

Ray trace methodology

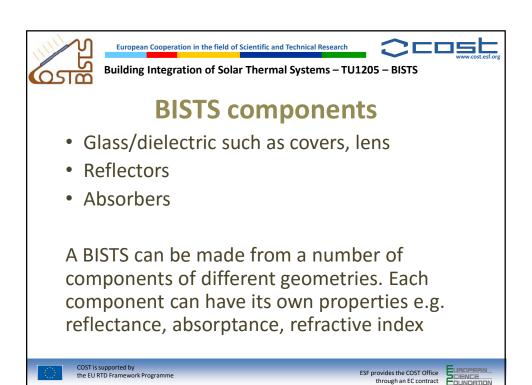

- Sunlight simulated by equally spaced parallel rays incident of the collector aperture
- The solar collector/system is simulated as a collection of components (e.g. the glass aperture, the absorber etc.)
- Its ray is trace from its origin to the next point of intersection with one of the collector components

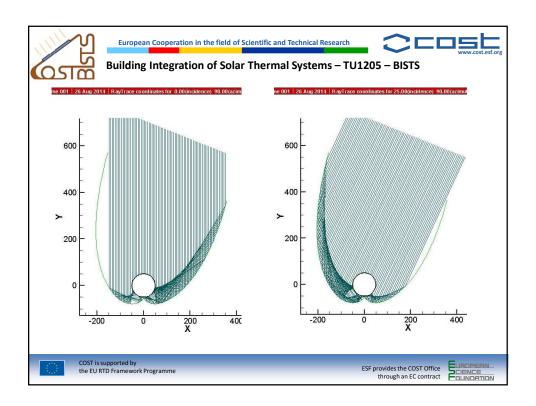

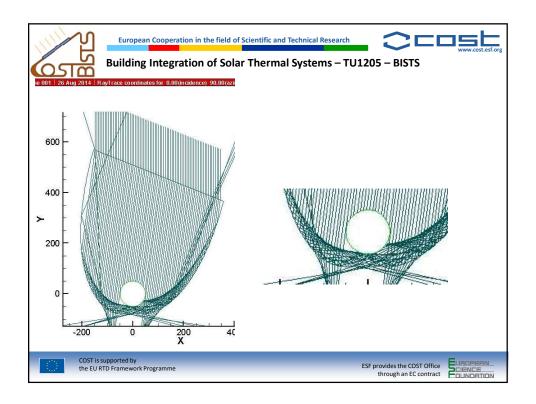

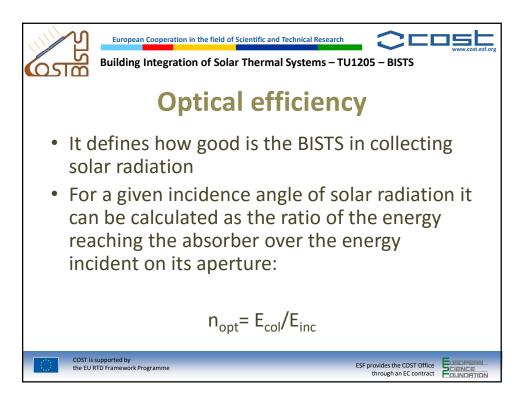

- At its intersection with a collector component the appropriate laws are applied to calculated the new direction of the ray and energy exchanges
- Each ray is traced until it reaches the absorber or exits the collector

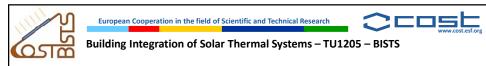

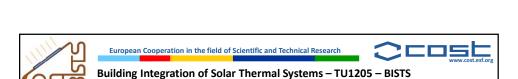

Optical efficiency

- For some BISTS optical efficiency can be a strong function of the direction of the incident solar radiation. For example BISTS that use concentrators or lens.
- For BISTS with flat geometry (non-concentrating) the optical efficiency also vary with the incidence angle of solar radiation but only due to the effects of reflectance on glass aperture for example.

COST is supported by the EU RTD Framework Progra

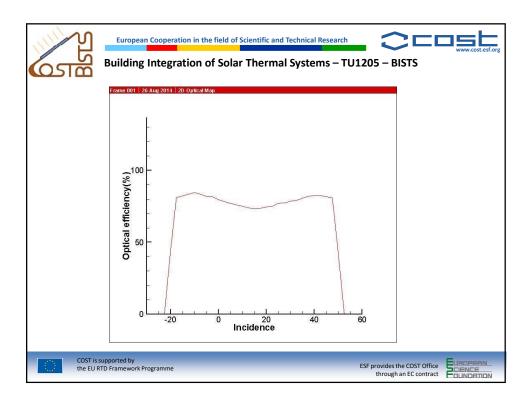

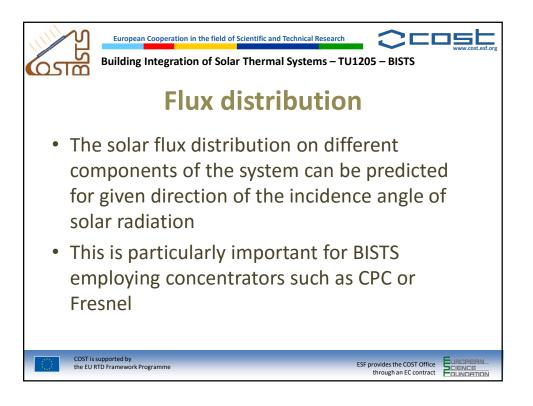

ESF provides the COST Office through an EC contract

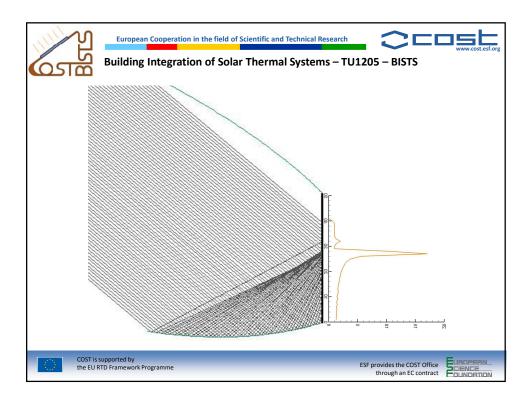

Optical efficiency

 To fully optically characterise a BISTS its efficiency needs to be determined for the full range of incidence angles of solar radiation on its aperture

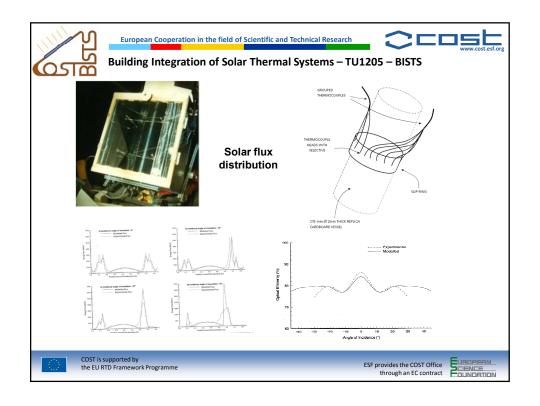

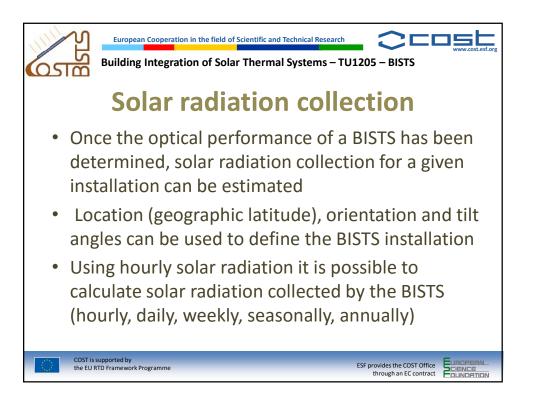

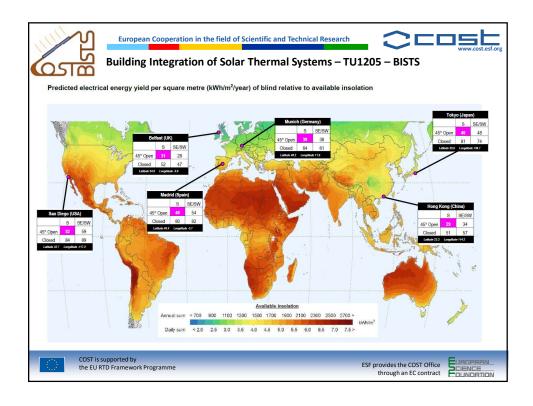

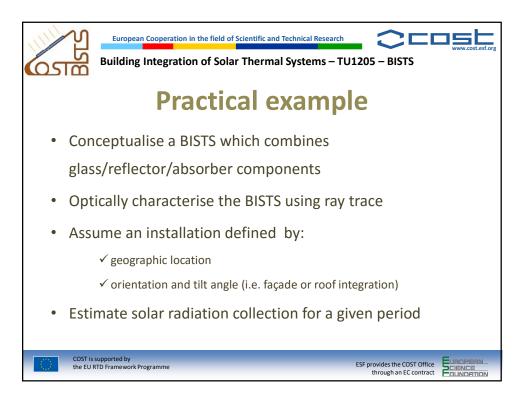

European Cooperation in the field of Scientific and Technical Research

Building Integration of Solar Thermal Systems - TU1205 - BISTS

Do you think you now have a good understanding of

- What optical modelling is and how it can be used to investigate the properties of a BISTS
- The principles of the ray-trace methodology
- · Optical performance and solar radiation collection of a BISTS for a give installation
